

# Bayport-Pioneer Rebuild Project

## Overview

American Transmission Co. has determined that approximately 21 miles of 69,000-volt transmission line north of Green Bay, Wis., needs to be rebuilt and upgraded to 138-kV to serve the electric load in the area effectively and reliably. The 1910s-vintage lattice structures and wires have reached the end of their life cycle and will be replaced between the Bayport Substation in Brown County and the Pioneer Substation in Oconto County.

The project includes:

- Replacing the transmission structures between Bayport and Pioneer substations with poles that support two 138-kV circuits,
- Replacing the existing wires and installing a second set of wires, both to be operated at 138-kV, and
- Making upgrades at the Bayport, Pioneer, Pulliam, Sobieski and Suamico substations.

The estimated \$47 million project requires approval by the Public Service Commission of Wisconsin. The PSC Docket Number is 137-CE-190. Additional information, including details of our regulatory filing, can be found at [psc.wi.gov](http://psc.wi.gov) or [atc-projects.com](http://atc-projects.com).

## Timeline

File regulatory application with PSCW.....	Spring 2019
Regulatory review .....	Summer/Fall 2019
Anticipated approval.....	Late 2019
Detailed engineering/design .....	Late 2019/Early 2020
Begin construction activities.....	Late 2020
In-service date .....	Mid-2022
